

ALA: 1-Python

Error : 1- Indentation Error

- Python uses **indentation (spaces)** to define blocks of code.
Inside **while** and **if**, your lines were **not indented**.

- Wrong :

```
while i <= n: term = a * (r ** i)
```

- Correct :

```
while i <= n: term = a * (r ** i)
```

- **ERROR 2: Wrong GP Formula (Logical Error)**

- Problem :

```
term = a * (r ** i)
```

- Fixed Code :

```
term = a * (r ** (i - 1))
```

- **ERROR 3: Indentation inside if-else**

- Problem:

if and else blocks were not indented

- Wrong :

```
if term % 2 == 0:  
    print("Even term:", term)
```

- Correct :

```
if term % 2 == 0:  
    print("Even term:", term)  
else:  
    print("Odd term:", term)
```

- **ERROR 4: Missing Closing Parenthesis**

- Problem :

```
print("Total sum:", sum_total
```

- Correct :

```
print("Total sum:", sum_total)
```

- **ERROR 5 : Using = instead of ==**

- Problem :

```
if r = 1:
```

- Correct :

```
if r == 1:
```

- **ERROR 6: Wrong Placement of if-else (Logical Error)**

- Problem :

The series type check was placed **inside the loop logically**, but it should run **once after the loop**.

- Correct Placement :

```
print("Total sum:", sum_total)
```

```
if r == 1:
```

```
    print("Constant series")
```

```
else:
```

```
    print("Changing series")
```

- **ERROR 7: No Proper Block Structure**

- **Problem :**

- **Code mixed:**

- loop code
- print statements
- condition checks

- **Correct Structure :**

1. Input
2. Loop (calculate terms)
3. Print sum
4. Check series type
